Thermal Spray connects:
Explore its surfacing potential!

Basel, Switzerland
May 2 - 4, 2005

Editor: E. Lugscheider

Conference Abstracts
(including manuscripts on CD-ROM)

Organizers:

DVS - German Welding Society
ASM International - Thermal Spray Society (TSS)
IIW International Institute of Welding
Table of contents / Abstracts: ITSC 2005

Economic aspects

The current situation and future of thermal spraying industry in China ......................................................... 1
The global thermal spray market – an overview of industry trends and dynamics .......................................... 1
Doing business in China – from necessity to competitive advantage ................................................................. 1
Difference in thought of Japanese small and medium companies obtained by analyzing questionnaire results from the viewpoint of cost ......................................................... 1
Thermal spraying-application and development trends ....................................................................................... 1

Applications / Case studies I

Carbide coatings on fibre-reinforced anilox rollers using the TeroStar®-process ................................................. 1
New powder blends based on Cobalt superalloys to obtain near-net shape parts by HVOF ................................ 2
Property analysis of thermal sprayed glass-composite coatings ................................................................... 2
Thermal spray based rapid manufacturing, part refurbishing and reengineering .............................................. 2

Cold spray I

Effect of the substrate surface activation on the process of cold spray coating formation .................................. 2
Microstructure and property of LTHVOF sprayed copper coatings ................................................................. 2
High resolution microstructural investigations of interfaces between light weight alloy substrates and cold gas sprayed coatings ................................................................................... 2
The cold spray process and its potential for industrial applications ................................................................. 3
Influence of powder size on the structures and properties of the cold sprayed copper coatings .................. 3

Modelling / Simulation II

integrating a deposition model for off-line spray tools programming ............................................................. 3
Modeling of non-equilibrium supersonic plasma jets at low pressure .............................................................. 3
Thermal spraying – simulation of coating structure ......................................................................................... 4
XFEM modeling of effective thermal properties and fracture of thermal barrier coatings ................................. 4

Equipment / Processes II

Modified supersonic nozzles for the vacuum plasma spraying ........................................................................... 4
Constructive aspects for the application of hard-metal coatings using High Velocity Oxygen Fuel Flame Spraying (HVOF); experience and examples ............................................................ 4
The coating properties of carbide cermet coatings produced by HVOF-YAG hybrid spraying ................... 4
Investigation of relationship between spray parameters and Al2O3 coating properties controlled by on-line monitoring system ........................................................................................................ 5
Plasma torch developments ............................................................................................................................... 5
High quality coatings by VPS with combined IC/DC-spraying technology .................................................. 5

Equipment / Processes III

LPPS thin film technology for the application of TBC systems ........................................................................ 5
Functionally graded coatings by HVOF-Arc hybrid spray gun ......................................................................... 5
Coatings obtained by low pressure plasma spraying ......................................................................................... 6
Continuous coating of technical textiles from "coil to coil" .............................................................................. 6
Adjusted thermal spraying layers to enhance the electromagnetic forming of metal sheets .......................... 6

Nanostructured materials I

Production of samarium doped-ceria plasma sprayed nano-coatings using an internal injection of a suspension containing nanoparticles ................................................................. 6
Calcium phosphate coatings produced by solution precursor plasma spray ................................................ 6
The influence of post heat-treatment on the wear properties of nano-structured WC-Co coatings .................. 7
Cold spray deposition of nanocrystalline materials ......................................................................................... 7
Thermal shock resistance of thick graded nanostructured zirconia-NiCoCrAlY composite coatings by plasma spraying .......................................................................................................... 7
Equipment / Processes IV

Plasma plume condition forming of cascaded type plasma guns ....................................................... 7
Shock wave physical mechanisms of modulated arc as applied to dusted plasma flows to form the coatings ................................................................. 8
Photocatalytic decomposition of nitrogen oxides over TiO_2 coatings elaborated by liquid feedstock plasma spraying .................................................. 8
Robotic trajectory autogeneration in thermal spraying .............................................................................. 8

Plasma spraying III

Improvement of DC thermal plasma spraying by reducing the cold gas entrainment effect .......... 8
Cermet coating by APS: Influence of the ceramic phase and the particle size range on the mechanical properties .......................................................... 8
Particle properties during plasma-spraying of yttria stabilized zirconia using a Triplex-II torch .................. 9
Development and Properties of Tungsten-Based Coatings Sprayed by WSP(R) ......................................... 9
Plasma sprayed ultra high temperature ceramic materials tested in simulated operative conditions .......... 9
Coating deposition of bearing materials on connecting rod by thermal spraying ..................................... 9

Applications / Case studies V

Local wear protection for demountable automotive aluminum draw bars by thermal spray coatings ........ 9
Plasma sprayed beryllium high heat flux components ........................................................................... 10
Metal passivation to resist corrosion using the cold spray process ......................................................... 10
Diffusion barrier coatings for graphite, C/C and C/SiC racks in vacuum heat treatment or high temperature brazing processes ................................................. 10
Evaluation of interfacial adhesive toughness by simulation of crack propagation in interfacial indentation test ................................................................. 10

Process diagnostics II

Real time Control for plasma spray: sensor issues, torch nonlinearities, and control of coating thickness ............................................................... 11
Plasma spray process control with neural network .................................................................................. 11
On the measurement of substrate temperature during thermal spraying ................................................. 11
Fast determination of particle critical velocity in cold spraying ............................................................. 11

Nanostructured materials III

A computational heat and mass transfers model for a laser pyrolysis reactor ......................................... 11

Equipment / Processes I

Progress in thermal spray processes ........................................................................................................ 12
Characteristic of the arc length and voltage in a DC Bi-Anode plasma torch ........................................... 12
Influence of powder size distribution and heat flux on yttria stabilised coatings elaborated by liquid suspension injection in a DC plasma jet ............................ 12
Influence of the voltage modulation frequency on voltage trace and wire arc coatings properties .......... 12
Surface preparation of steel substrates using Grit-Basting .................................................................... 12
Near-net shape forming of tungsten material by induction plasma deposition ....................................... 13

Corrosion protection I

HVOF sprayed Ti(Al,O)/Al_2O_3 based composite coatings for high temperature applications ............... 13
HVOF coating of metallic surfaces: corrosion and bending characteristics of coating ............................. 13
Microstructure and electrochemical corrosion behavior of the Zn-Al-Mg coatings produced by cored wires and high velocity arc spraying .................................. 13
Dense titanium coatings by modified HVOF spraying ........................................................................... 13

Properties / Characterization / Testing I

Experimental investigation of influence of plasma spraying operational parameters on properties of hydroxyapatite ................................................................. 13
Influence of annealing condition on crystallization behavior and mechanical properties of thermal sprayed PEEK coating ..................................................... 14
Oxidation study of high temperature Ti compatible abradable seal ......................................................... 14
Impact behaviour of HVOF-sprayed WC-CoCr coatings ........................................................................ 14
Plasma sprayed cast iron coatings containing solid lubricant graphite and h-BN structure .................. 14

Properties / Characterization / Testing II

Influence of the grit blasting process on the properties of thermally sprayed coatings ............................ 15
Adhesion tests for thermal spray coatings: Application range of tensile, shear and interfacial indentation methods ................................................................. 15
Stress-relaxation and creep behavior of heat-treated stand-alone plasma-sprayed 7 wt.% Y₂O₃-ZrO₂ coatings

Computational evaluation of thermal barrier coating characteristics under plasma spraying

Plasma spraying I

Simultaneous deposition of LSM and YSZ for SOFC cathode functional layers by an APS process
Microstructures of sprayed SiCp/Al composites
The influence of spraying parameters on in-flight characteristics of tungsten particles and the resulting splats sprayed by hybrid water-gas stabilized plasma torch
Cytocompatibility of plasma sprayed bioceramic coatings
Influence of the injection parameters on the suspension plasma spraying coating properties
Control of Coating Properties of Abradable Seals by On-Line Process Diagnostics

Applications / Case studies III

Repair of multi-layered, polymer-based thermal spray coatings
Development of durable spray coatings in molten aluminum alloy
Reengineering of boiler feed pump using high performance coatings
Plasma Sprayed Coatings for the Improvement of Chemical Resistance of Ceramic Refractories
Manufacturing of metal foam composites through multifunctional coatings – the new easy Foam-process

Properties / Characterization / Testing III

Photocatalytic properties of nanostructured TiO₂ and TiO₂-Al coatings elaborated by HVOF spraying
Effects of substrate surface condition on the flattening behavior of impinging splat
In-flight particle characterization of HVOF-Arc hybrid gun
Friction and wear behavior of plasma sprayed Al₂O₃ and Cr₂O₃ coatings against copper alloy under high load dry sliding
Microstructure and properties of nanostructured WC/Co coating deposited by supersonic plasma spraying

Process diagnostics I

In-flight particles analysis for the characterization of the arc spray process
Correlation of inflight particle parameters and properties of HVOF sprayed cermet coatings
Plasma-sprayed particles : Impact imaging and flattening particle thermal history
Aerodynamic Characteristics of High-Velocity Oxy-Fuel Thermal Spray Process

Wear protection

Investigation of ceramic and hardmetal coatings in an oscillating sliding wear test
Correlation of microstructure with abrasion and oscillating wear resistance of thermal spray coatings
Fractographic approach to wear mechanisms of selected thermally sprayed coatings
Wet spray coatings for heavy equipment industry
HVOF sprayed high chromium and high vanadium containing iron based hard coatings for combined abrasive wear and corrosion protection
Statistical modeling of thermal spray welding of steel-shaft materials for wear resistance

Properties / Characterization / Testing IV

Correlating the spray pattern to the coating architecture: exploring the dominant mechanisms and process parameters
Measuring thermal contact resistance between molten aluminum droplets and a steel plate
Microwear in thermally sprayed hard coatings by different abrasives
Shear testing for characterizing the adhesive and cohesive coating strength without the need of adhesives
Plasma spraying of a novel material with amorphous and nanocrystalline microstructure

Properties / Characterization / Testing V

Properties of Composite Coatings Sprayed by the Low Temperature High Velocity Air Fuel Spray
Characterization of the porosity of a TBC sprayed by a high power plasma system for SOFC application
Nanostructures in thermal sprayed hydroxyapatite (HA) and HA/nano-zirconia coatings and their influence on coating properties
Corrosion and tribological behaviour of polyamide-nitride composite coatings
Fatigue and Mechanical Properties of Nanostructured vs. Conventional Titania (TiO₂) Coatings

Plasma spraying I

Phase formation mechanisms in plasma sprayed hydroxyapatite coatings
Plasma spraying behaviour and properties of Aynthesized/Agglomerated Calcium/Magnesium zirconates versus Lime/Magnesia stabilized zirconia .......................................................... 24
Self propagating high temperature synthesis of aluminium-matrix-composite coatings by means of atmospheric plasma spraying ........................................................................................................... 24
Fluid dynamic stability of plasma spray jets ................................................................................................................. 24
Examining the variations in splat properties within the footprint of a spray stream ..................................................... 24
Plasma sprayed oxide surfaces in aqueous environments ................................................................................................. 25

Plasma transferred arc surfacing
Full mechanised cladding of 3-dimensional components in constrain position with the PPAW-process ..................... 25
Computer simulation of heat transfer and phase state under high-energy flux impact on solid body surface .......... 25
Formation of nanoscale composite coatings via HVOF and wire-arc spraying ......................................................... 25
Development of highly wear resistant iron based PTAW hardfacing alloys ............................................................. 26

Modelling / Simulation I
Study of magnetic properties of iron-based thermally sprayed coatings .......................................................... 26
Nozzle exit geometry and lump formation in APS ........................................................................................................... 26
Finite elements modelling of transient thermal stresses developed in ceramic coatings during thermal cycling conditions .......................... 26
Numerical analysis of injection diesel spray using modified KIVA code and comparison to experimental works .................. 26
Modeling of temperature and residual stress fields resulting from impacting process of a molten Ni particle onto a flat substrate ........................................................................................................ 27

Applications / Case studies II
Design, fabrication and characterization of sprayed multilayered thermopiles ....................................................... 27
Automated cold spray system: Description of equipment and performance data ...................................................... 27
TeroComposite® - coating solutions against high-temperature corrosion and erosion in boiler applications .................. 27
The relation between temperature of substrate and the composition, structure and corrosion resistance of the zinc coated extruded aluminum multi-void for automotive air conditioning unit ........................................... 27

Thermal barrier coatings II
Manufacture and properties of segmented thermal barrier coatings ........................................................................ 27
Study of CVD overaluminising on different CoNiCrAlY bond coats deposited by High Velocity Oxygen Fuel (HVOF), Low Pressure Plasma Spray (LPPS) and Vacuum Plasma Spray (VPS) ........................................ 28
Thermal conductivity evaluation and comparsion of APS low density and dense vertically segmented advanced thermal barrier coatings .............................................................................................. 28
Corrosion protection II
Development of highly molten chloride corrosion resistant coatings assisted by mechano-chemical reaction .......... 28
Effect of angle of impingement on erosion-corrosion behaviour of a WC-Co-Cr HVOF sprayed coating .................. 28
Properties of Thermally sprayed coatings on magnesium parts for enhancement of wear and corrosion resistance .......................................................... 28

Cold spray II
Cold spray flow modeling and validation ....................................................................................................................... 29
Effect of heat treatment on the structure and properties of cold sprayed copper ................................................................................................................................. 29
Production of freeform net shape components by cold gas dynamic spray .......................................................... 29
Study on cold-sprayed copper coating’s properties and optimizing Parameters for the spraying process .................. 29
Particle in-flight velocity measurements from particle image velocimetry in cold spray ........................................... 30

Cold spray III
Particle loading effect in cold spray ............................................................................................................................... 30
Kinetic deposition of ti coatings using gas atomized ti powder particles ............................................................... 30
Nano- and microcrystalline cold spray coatings ............................................................................................................ 30
Effect of particle geometry and substrate preparation in cold spray ......................................................................... 30
Spray forming titanium alloys using the cold spray process ...................................................................................... 30

Applications / Case studies IV
Microstructure of Ni-graphite / YSZ composite coatings on porous metallic substrates obtained by Atmospheric Plasma Spraying (APS) .................................................................................. 31
Effect of ternary gas mixtures on the microstructure of refractory metals and alloys deposited by low pressure plasma spraying ........................................................................................................ 31
HVOF burner system, designed with special regard to heat management ................................................................. 31
High-temperature tensiometry by a coupled modeling and experimental approach .................................................. 32

HVOF II
HVOF coatings properties of the newly thermal spray composition WC-WB-Co .......................................................... 32
Influence of spraying parameters on the properties of HVOF alumina coatings ......................................................... 32
Analysis of thermal fluxes transferred by an impinging HVOF jet .............................................................................. 32
Nanoreinforced HVOF -sprayed ceramic coatings ........................................................................................................ 32
Impact modeling of thermally sprayed polymer particles ............................................................................................ 32
Observation of deformation and microstructure at the interface between WC-Co HVOF sprayed coating and carbon steel substrate ............................................................................................................ 33

Cold spray IV
Kinetically sprayed Cu coatings: effects of particle characteristics ............................................................... 33
Cold spraying – innovative layers for new applications ............................................................................................. 33
Alloying of cold-sprayed Al-Ti, Al-Ni composite films .............................................................................................. 33
Examination of the critical velocity for deposition of particles in cold spraying ......................................................... 34
Production of titanium deposits by cold gas dynamic spray ......................................................................................... 34

Cold spray V
High velocity impact phenomena and coating quality in cold spraying ....................................................................... 34
Cold spray nozzle design and performance evaluation using particle image velocimetry (PIV) ........................................ 34
Effect of heat treatment on properties of cold sprayed coatings ................................................................................... 34
Cold spray of Al-Cu-Mg-Fe-Ni alloy with Sc addition ................................................................................................. 35
The effect of a simple annealing heat treatement on the mechanical properties of cold-sprayed aluminium ............. 35

Pre-treatment / Post-treatment
Controlled removal of HVOF hard coatings by abrasive water jet ................................................................................ 35
Surface modification induced by the pulsed Nd-YAG laser irradiation in the PROTAL® process ................................... 35
Relationship between surface topography parameters and adhesion strength for plasma spraying ................................. 35
Influence of post heat treatment on microstructure and wear properties of thermally sprayed WC-Co coatings ........... 36
Improvement of mechanical properties of Alumina and Zirconia plasma sprayed coatings induced by laser after-treatment .................................................................................................................. 36
Influence of reduction process on the microstructure and composition of plasma sprayed Al2O3TiO2/CuO composite coating .................................................................................................................. 36

Quality inspection / Quality assurance / Quality management
The quality control in plasma spraying ceramic coating on large area substrate ............................................................... 36
Non destructive testing of the coating-substrate interface of thermally-sprayed industrial parts non-destructive testing of the coating-substrate interface of thermally-sprayed industrial parts ................................................................. 36
The Laser Shock Adhesion Test (LASAT) for production control of thermally-sprayed ceramic coatings .................. 37
Experiences in education/training and qualification of thermal spraying personnel according international guidelines and standards .................................................................................................................................. 37

Thermal barrier coatings I
Development of metal based thermal barrier coatings (MBTBCs) for low heat rejection diesel engines ....................... 37
Thermo mechanical behaviour of nano structured plasma sprayed thermal barrier coatings ........................................ 38
New concepts for plasma sprayed zirconia TBCs for aeronautical applications .......................................................... 38
Formation of TiN-Al2O3-ZrO2 composite coatings by gas tunnel type plasma spraying ............................................. 38
Comparative study on segmented thermal barrier coatings sprayed from different feedstocks ........................................ 38

Arc spraying
Shear force on wire tips in wire arc spraying system ................................................................................................. 38
Comparative Study of wear and corrosion properties of electric arc thermally sprayed coatings ................................ 39
Reinforced lightweight composite materials .................................................................................................................. 39
Supersonic nozzles for the wire arc spraying ................................................................................................................ 39
A comparison of Cr3C2-NiCr coatings obtained by HVOF using propylene and hydrogen as fuel gases ........................................ 39
Properties of HVOF sprayed multi-scale polymer/silica composite coatings ................................................................. 39
Carbide containing materials for hard chromium replacement by HVOF-spraying ......................................................... 40
HVOF spraying of WC-Co coatings with liquid-fuelled and gas-fuelled systems: competing mechanisms of structural degradation ......................................................... 40
Oxidation of HVOF-sprayed hardmetal coatings ............................................................................................................. 40
Corrosion properties of X-HVOF corrosion protective coatings ....................................................................................... 40

Modeling / Simulation III
A systematic approach to particle-substrate interactions in thermal spraying ................................................................. 41
A thermal and chemical non-equilibrium model for multi-component Ar-H₂ plasma ......................................................... 41
Effect of the surface adsorbates on the morphology of plasma-sprayed splats ............................................................... 41
Finite element modelling of acoustic emission behaviour of thermally sprayed WC-Co coatings .................................. 41
Particle treatment modeling in a time-dependent D.C. plasma flow ........................................................................ 41

Nanostructured materials II
Microstructural observation of the sintering behavior of nanostructured yttria stabilized zirconia .................................... 42
Injection conditions and in-flight particle states in suspension plasma spraying of alumina and zirconia nano-ceramics ...... 42
RF plasma deposition of half-cell (Anode – Electrolyte) assembly of medium temperature planar solid oxide fuel cell ...... 42
Deposition and crystallization of thermally sprayed amorphous metallic coatings ....................................................... 42
Comparative study of the properties of WC-Co nanostructured and bimodal coatings, sprayed by high velocity oxy-fuel (HVOF) ................................................................. 43

Laser spraying
High rate deposition of protective coatings by high power diode laser (HPDL) ............................................................... 43
Microstructure characterization of WC-25%NiCr cermet coating by plasma laser hybrid spraying technique ............ 43
Microstructures and abrasion resistances of laser cladded MMC-coatings .............................................................. 43
New technique of laser cladding with tungsten carbide and diamond ........................................................................ 43

Consumables / Gases
Modern Gas Supply Concepts for Thermal Spraying .................................................................................................... 44
MoSi₂ coatings on titanium alloy substrates for high temperature oxidation protection of moved parts .................. 44
Hot gas atomized melts - potentials for thermal spray powders ....................................................................................... 44
Development of a technique for hard coating of component parts by synthesis of silicon carbide in thermal spray processes .............................................................................. 44
Influence of WC-Co type thermal spray powder characteristics on HVOF coating properties .................................. 45
Hydroxyapatite coating of biomimetic polymer composite materials ............................................................................ 45

Modeling / Simulation IV
Short-pulse laser post processing of PTA and thermal sprayed wear and corrosion resistant coatings ......................... 45
Modelling the plasma torch: numerical and analytical models to describe the temperature and velocity distribution inside a F4 torch ........................................................................ 45
Laser shock flyer impact simulation of particle-substrate interactions in cold spray ..................................................... 46
Usefulness of 3-D time dependent models and steady 2-D models in plasma spraying engineering? .......................... 46
Computational Simulations and Experimental Characterization of the Mechanical and Fracture Behaviour of Alumina-Glass Plasma Sprayed Coatings ................................................. 46

Nanostructured materials IV
Formation of nanoscale composite coatings via HVOF and wire-arc spraying .......................................................... 46
Study of Ni/Al₂O₃ deposition on metallic surface using RF plasma process ................................................................. 47
Advanced nanoscale neutron absorber coatings for safe longterm storage of spent nuclear fuel and nuclear waste ........ 47
Nanostructured and conventional titania coatings for abrasion and slurry-erosion resistance sprayed via APS, VPS and HVOF ..................................................................................... 47
Magnetic properties of HVOF thermally sprayed coatings obtained from nanostructured powders ............................ 47
ITSC 2005 Poster session

Applications / Case studies

Optimizing of LVOF spray parameters to coat ceramics by studying particles In-flight characteristics ................................................. 47
Characteristics of BSCCO thin films fabricated by using the layer by layer deposition and evaporation deposition method ............... 48
Research on microstructure and properties of Ni-Al2O3 coatings produced by HVO/AF .......................................................... 48
Thermal properties of continuously graded thermal barrier coatings deposited by supersonic plasma spray ........................................... 48
High temperature characteristics research of CoCrAIYTa coating .............................................................................................. 48
Air gas dynamic spraying of powder mixtures: theory and application ............................................................................. 48

Equipment / Processes

Thermal spray particulate and it's challenges for dust collection equipment ............................................................................ 48
Alumina-titania coatings deposited by laser-assisted air plasma spraying: microstructure and mechanical characterization .......... 49
The effects of deposition parameters and gaseous detonation equipment design on the coating formation ........................................ 49
The development of a high efficiency supersonic plasma system ............................................................................................... 49
Construction and analysis of ozone condensation system for oxide superconductor thin film .............................................. 49

Arc spraying

Research on the coating performance produced by arc spraying using high velocity high energy combustion gas .................. 50
Oxidation behavior of in-flight molten aluminum droplets in the twin-wire electric arc thermal spray process .......................... 50
Corrosion resistance and microstructure of arc-sprayed Zn-Al and Zn-Al-Mg coatings ......................................................... 50

Plasma spraying

Irregularity parameter and sphericity of plasma sprayed nickel powders ................................................................. 50
Correlation of plasma process conditions, phase content, and photocatalytic performance of induction plasma-sprayed titania coatings ................................................................. 50
Corrosion properties of plasma-sprayed coatings using oxide powders .................................................................................. 51
Plasma sprayed self lubricant coatings ................................................................................................................................. 51
In-flight behavior of Ni-Al powder during its plasma spraying .................................................................................................. 51
Development of gas-tight zirconia electrolyte layers by atmospheric plasma-spraying .......................................................... 51
Thermal fatigue testing of ceramic coatings produced by water-stabilized plasma gun ...................................................... 52
Stress gradients in plasma sprayed chromia coatings .................................................................................................................. 52
Visualization of impact of plasma-sprayed molybdenum particles on hot and cold glass substrates ........................................... 52
Influence of the spray parameters and particle size on the treatment of Fe-Cr and stainless steel particles in flight in APS .......... 52
Qualification of a modified triplex II plasma gun for processing of liquid precursors and wire- or powder shaped spray materials under controlled atmosphere ................................................................. 52
Performance comparison of various sensor systems and plasma spray torches ................................................................. 53
Relationship between the elastic modulus and microstructure in vacuum plasma sprayed structures ....................................... 53
Preliminary study on plasma spraying of ion conducting oxides on Bi2O3 base ............................................................... 53

HVOF

High crystallinity degree hydroxyapatite coatings using HVOF spraying ............................................................................. 53
Stellite 6 coatings obtained by HVOF using different fuel gases ............................................................................................... 53
Analysis of bonding mechanisms during thermal spraying ......................................................................................................... 54
The relation between the morphology of powders and the spraying parameters and structure of coatings in the HVOF spraying .................................................................................................................. 54
Thermal spraying of basalt for abrasion protective coatings using WSP, HVOF and APS ......................................................... 54
Effect of spray parameters on the cracking and spalling behavior of WC-17% Co cermet coatings .............................................. 54
HVOF deposition of SOFC interconnect materials .......................................................................................................................... 54

Cold spray

On the influence of the substrate hardness on cold-sprayed nickel coating ................................................................................ 55
CGS sprayed filler coatings for brazing of light weight alloys ........................................................................................................ 55
Kinetic spraying deposition behavior of bulk amorphous NiTiZrSiSn feedstock ............................................................... 55
Effect of annealing treatment on the microstructure and properties of cold-sprayed Cu coating ................................................. 55
Laser spraying

Effective Laser-Cladding through the application of magnetic induced forces ............................................ 56
Laser coating and thermal spraying - process basics and coating properties ................................................ 56
Study of laser ablation in conjunction with wire arc spraying of Al-5Mg coating onto 7075 Al alloy ................. 56

Plasma transferred arc surfacing

Suitability of high power diode laser for Plasma-Augmented-Laser-Cladding (PALC) ............................... 56
A multi-wire ARC-HVOF hybrid gun ............................................................................................................. 57

Process diagnostics

Improved process controls of combustion sprayed clearance control coatings through sensor diagnostic technology ................................................................. 57
In-flight particle diagnostic of water stabilized plasma spray process ........................................................... 57
Characterization of the particle jet of different HVOF guns by means of LDA .............................................. 57
Diagnosis of in-flight particles during arc spraying of carbon steel and relationships with microstructures of the deposited layers ........................................................................................................ 57
Influence of reflected radiations on in flight particle temperature measurements ...................................... 58
Diagnostic and microstructure of FeSi coatings sprayed by HVOF ............................................................. 58

Modeling / Simulation

Computational modelling of a thermo-abrasive blasting gun ................................................................. 58
Parametric study of the transient cooling during suspension d. c. plasma spraying of stabilized zirconia ........ 58
Microstructure Characterization of thermal barrier coating deposits – practical models from measurements ................................................................. 58
Modeling of combustion assisted thermal spray processes ........................................................................ 59
Modeling of an YSZ coating building and thermomechanical behavior during plasma-spraying .............. 59
Modeling of the heating of cast iron particles during plasma spraying ........................................................ 59
Computer simulation of injected particle behavior during cold spray process ........................................... 59
Numerical study of particle in-flight characteristics in a RF induction plasma spray .................................. 59
Study on the photo catalytic ability of plasma splayed TiO₂-HAP compound coatings ............................ 60
Circumstantial theoretical analysis of oxide ceramics splat formation ....................................................... 60
Some key advices for the modeling of plasma jets using FLUENT .......................................................... 60
Impact and solidification of droplets onto rough substrates .......................................................................... 60
Transient thermal analysis and coating formation simulation of arc spray process .................................... 60

Pre-treatment / Post-treatment

Effect of substrate surface change by heating on flattening behavior of thermal sprayed particles ............... 60
Interaction between a thin non continuous d.c. plasma sprayed alumina layer and preoxidized low carbon substrate ........................................................................................................... 61
Residual grit on the substrate surface in roughening treatment: quantitative evaluation and a reduction technique ................................................................. 61
Role of the laser surface preparation on the adhesion of Ni-Al 5% coatings deposited using the PROTAL ® process ................................................................. 61

Thermal barrier coatings

Compound coatings of MCrAIY and alumina prepared by detonation thermal spraying ............................ 61
Thermal properties of continuously graded thermal barrier coatings deposited by supersonic plasma spray ................................................................. 62
Splat formation under YSZ hollow droplet impact onto substrate ................................................................ 62
Design of alternative multilayer thick thermal barrier coatings ................................................................. 62
Thermal behavior of Y-PSZ TBCs in situ remelted during their deposition .............................................. 62
Pore network architecture and thermal conductivity of Y-PSZ TBCs in situ remelted during their deposition ................................................................. 63
Improving thermal cycling life of thermal barrier coatings using cryomilled nanostructured NiCrAIY powder as feedstock material ................................................................. 63

Nanostructured materials

Sliding wear of plasma sprayed ZrO₂ coatings using nanostructured powder ........................................... 63
Suspension plasma spraying of nano-ceramics using an axial injection torch ............................................. 63
Nanostructured NiTi coatings produced by low pressure plasma spraying ............................................... 64
Relationship between process parameters and microstructure and wear characteristics of plasma sprayed nanostructured Al₂O₃-TiO₂ ceramic coatings ................................................................. 64
Improvement of nanostructured WC base coatings ..................................................................................... 64
Collection of nano-powders generated by radio frequency (RF) plasma spray synthesis (PSS) processing, using a sampling probe ................................................................. 64
Synthesis and characterization of nano-size La0.8Sr0.2Mo3-d cathode materials by induction plasma ................................................................. 64
New thermal spray coatings from WC-VC-Co powders ................................................................. 65

Wear protection

A Comprehensive characterization of industrially manufactured hard chrome platings and of thermally sprayed alternatives ................................................................. 65
The delamination wear mechanism of thermally sprayed coating ................................................................. 65

Corrosion protection

Investigations on corrosion protective layers in waste incineration plants ................................................................. 65
Effects of rare-earth metal on microstructure and corrosion resistance of arc-sprayed Zn-Al-Mg coating ................................................................. 65

Properties / Characterization / Testing

Effect of surface oxidation on transition temperature of stainless steel substrate upon impact of aluminum particles ................................................................. 66
Microstructure analysis of thermally sprayed abradable coatings ................................................................. 66
Topological characterization of wear tracks in thermally sprayed abradable coatings ................................................................. 66
Investigation of the structure of plasma and HVOF sprayed composite coatings ................................................................. 66
Characterization of nano WC-Co coatings produced by dynamic powder deposition ................................................................. 66
Charges generation and separation in plasma sprayed TiO2-Fe3O4 coatings ................................................................. 67
Direct observation of deformation and solidification process of metallic molten droplet on to substrate by using high speed video camera system ................................................................. 67
Study of the electrical conductivity of plasma-sprayed 4.5mol% yttria stabilized zirconia coatings ................................................................. 67
Study of lamellar microstructure of plasma-sprayed ZrO2-8wt.%Y2O3 coatings ................................................................. 67
Resin/Diamond surfaces enhance microstructural analysis of thermally sprayed coatings ................................................................. 67
Process maps for multimodal and conventional WC-12Co coatings ................................................................. 68
The indentation tests for evaluation of HVOF coatings’ mechanical properties ................................................................. 68
Elevated temperature erosion studies of twin wire arc sprayed cored wires ................................................................. 68
Analysis of thermal fluxes from an impinging HVOF jet ................................................................. 68
Examination of the Microstructure of Thermal Barrier Coatings ................................................................. 68

Quality inspection / Quality assurance / Quality management

Quality control of thermal spray processes through cost effective diagnostic methods ................................................................. 69
Quality management system implementation in LERMPS laboratory ................................................................. 69

Personnel training / Personnel qualification

Safety aspects and license requirement for thermal spraying ................................................................. 69

AIF Poster session

Dry ice blasting and water jet processes for the removal of thermal sprayed coatings ................................................................. 69

Industrial forum

Device for cold spray coating and winding of aluminum mesh ................................................................. 70
